

## TEL 150 - TELEPHONE HYBRIDS

phone hybrid - manual rating - unbalanced - RCA

The TEL 150 is a telephone hybrid that can be adapted to any console as a result of its multi-function flowchart for organising debates, conferences, games or just speeches made by members of the audience.

The TEL 150 is inserted between the mixing deck Output channel ("SEND" Output channel COMPACT console) and the console return ("RETURN" Input channel); it allows

- the console signal to be sent to the correspondent.
- the correspondent's interventions to be mixed with the console signal.
- the reversal of the hand set with the insert.
- orders to be sent to the correspondent.
- just the correspondent to be heard.

The use of a band-pass filter on the correspondent's cue allows the compliance with the overall specifications of the network, whilst improving the S/N ratio.

### **Applications :**

It can be inserted in a stereo cue on mixing decks that do not have a specific INSERT channel.

It can be used as a by-pass on mixing decks that have a specific COMPACT or RP 2000S INSERT channel.
